## CHAPTER-6 Inheritance: Extending Classes VERY SHORT/SHORT ANSWER QUESTIONS

					<u> </u>	
1.	What is inheritance? Discuss its various forms.					
Ans.	Inheritance is the capability of one class to inherit properties from another class.					
	Forms of Inheritance:					
	1. Single Inheritance: Or	ne base class and one supe	r class			
	2. Multiple Inheritance:	Multiple base class and on	e sub	class.		
	3. Hierarchical Inheritan	ce: One base class and mu	ltiple s	sub class.		
	4. Multi-level Inheritanc	e: A subclass inherits from	a class	s that itself inherit	s from another c	lass.
	5. Hybrid Inheritance: A	subclass inherits from mul	tiple b	ase classes and al	l of its base classe	es inherit from a single
	base class.					
2.	Discuss various reasons	that support the concept	of inh	eritance in Object	Oriented Langua	ages.
Ans.	The reasons that suppor	rt the existence of inherita	nce co	ncept in OO Langu	lages are:	•
	1. 'Inheritance' is capab	le of expressing the inherit	ance r	elationship of real	-world models.	
	2. 'Inheritance' facilitate	s the code reusability.				
	3. 'Inheritance' is canab	le of simulating the transiti	ve nat	ure of real-world'	s inheritance.	
3.	Differentiate between r	oublic and protected visibi	lity in	context of Object	Oriented Progra	mming giving suitable
•••	examples for each.		,			
Ans.	Pul	blic visibility			Protected visi	bility
	The public derivation n	neans that the derived clas	s can	The protected de	erivation means t	that the derived class
	access the public and r	protected members of the	hase	can access the p	ublic and private	members of the base
	class but not the privat	te members of the base cla	ss	class protectedly		members of the base
	With publicly dorived c	lass the public members of	of the	With protoctedly derived class, the public and protocted		
	base class become the	nublic mombars of the day	rived	with protectedly derived class, the public and protected		
	base class become the	public members of the base ele	iveu	of the derived of		le protected members
	class, and the protecte	d members of the base cla	SS	or the derived cl	ass.	
	become the protected members of the derived class.					
	Example:			Example:		
	class super			class super		
	{ private:			{ private:		
	int x; void get();		int x; void get();			
	public:			<pre>public. int v: void put():</pre>		
	int y; void put();			int y; void put();		
	protected:		int z: woid disp():			
		d disp(),		1 Int 2, Vold disp(),		
	}'			/ class sub:protected super		
	class sub-public super			{ private:		
	int a; void init();			int a; void init();		
	public:			public:		
	int b; voi	d readit();		int b; void readit();		
	protected:			protected:		
	<pre>int c; void writeit();</pre>			<pre>int c; void writeit();</pre>		
	};			};		
4.	How does the visibility	mode control the access o	f mem	bers in the derive	d class? Explain	with examples.
Ans.	Visibility mode controls	the access of member in d	erived	class by using acc	ess specifier. Bel	ow table shows different
	visibility modes.					
		Public inherita	ance			
	Base access specifier	Derived access specifier	Deriv	ved class access?	Public access?	
	Private	Private	No		No	
	Protected	Protected	Yes		No	4

		Private inherit	tance		1
	Base access specifier	Derived access specifier	Derived class access?	Public access?	]
	Public	Private	Yes	No	
	Private	Private	No	No	
	Protected	Private	Yes	No	J
	Example:				
	class A{ private	:			
	int a	; void init();			
	public:				
	int b	; void get();			
	protect	ed:			
	float	c; void put();			
	};				
	class B:public A				
	{				
	private:				
	char a	arr[10];			
	public:				
	void e	enter();			
	};				
	class C:private .	A			
	{				
	private:				
	float	f;			
	public:				
	void	show();			
	} ;				
5.	What should be the stru	ucture of a class when it ha	as to be a base class for	other classes?	
Ans.	class classname				
	{ private:				
	//memb	pers not intended to be inh	erited		
	public:				
	//memb	pers intended to be inherite	ed and available to every	v function	
	nrotected:			,	
	protected.				
	//members intended to be inherited but not intended to be public				
6	J, Discuss a situation in w	hich the private derivation	will be more appropria	to as compared	to public derivation
0.	When we want that the	derived class has the direct	t accoss privilage only to	the nen private	members of the base
Alls.	class in that situation th	a private derivation will be	access privilege only to	o the non-private	a derivation
-		le private derivation will be	e more appropriate as co		
7.	From a base class A, tw	o classes B and C are deriv	ing. B is deriving publici	y from A wherea	is C is deriving privately.
	The classes B and C, oth	erwise, are doing the simi	llar tasks. Discuss the sir	milarities and dif	ferences between the
	functioning of B and c.				
Ans.	<u>Similarities:</u>				
	Private members of the	base class A are not inheri	ted in derived class B and	d class C at all.	
	<u>Differences:</u>				
	In class B, the public and	l protected members of th	e base class A remain pu	iblic and protecte	ed whereas in class C, the
	public and protected me	embers of the base class A	become private membe	rs.	
8.	Identify the error(s) and	the responsible reason(s	) in the following code s	nippet:	
	class X {			••	
	public	C:			
	in	ta;			
	fle	oat b;			
	cha	ar c;			
	};				

```
class Y:public X {
                                 public:
                                     int d;
                                 private:
                                    X::a;
                            };
Ans.
      In above code X::a is nor allowed as we cannot deny access to certain members of a base class when inheriting
      publicly. Above error can be solved inheriting the class privately as following:
      class Y:private X {
                                 public:
                                     int d;
                                     X::a;
                            };
9.
      Identify the errors in the following code fragment. Discuss the responsible reasons for them.
      int glob;
      class F{
          int glob;
             public:
                void readit()
                { cin>glob; }
      };
      class W:public F {
           public:
               void test()
               { glob--; }
      };
      The compiler will not allow the class W to access F::glob as well as global glob because F::glob being private to F
Ans.
      cannot be accessed directly by the class W, and global glob cannot be accessed in W as it is hidden here because
      F::glob is visible here but inaccessible.
      Above error can be solved by writing following statement in test() method:
                             ::glob--;
      Given the definition of following two classes. Write the constructor definition for both classes.
10.
      class Alpha {
                          int a;
                          float b;
                          char c;
                      public:
                                         //constructor definition
                          . . . . . . . . . .
                                   // has to become here
                          :
                     };
      class Beta:public Alpha {
                                        public:
                                          . . . . . . . .
                                          //constructor definition
                                      };
Ans.
      class Alpha {
         int a;
         float b;
         char c;
           public:
                  Alpha(int i, float j, char k)
                          { a=i; b=j; c=k; }
      };
      class Beta:public Alpha {
```

```
public:
             Beta(int p,float q,char r):Alpha(p,q,r)
                 cout<<"Beta constructor..."; }</pre>
             {
     };
11.
     Define constructors for the classes defined below:
     class Alpha {
                     int a;
                    public:
                      float b;
                       ..... //the constructor definition
                       :
                  };
     class Beta {
                     int P;
                   public:
                     float q;
                      ..... //the constructor definition
                      :
                  };
     class Gamma {
                      Alpha A;
                      Beta B;
                      char X;
                    public:
                      double y;
                       . . . . . . . . . .
                          //the constructor definition
                       :
                   };
Ans.
     class Alpha
                      int a;
                    public:
                      float b;
                      Alpha(int x,float y)
                      { a=x; b=y; }
     class Beta {
                     int P;
                   public:
                     float q;
                     Beta(int i,float j)
                      { p=i; q=j; }
                  };
     class Gamma {
                      //Alpha A;
                      //Beta B;
                      char X;
                    public:
                      double y;
                      Gamma(char c,double d)
                       { x=c; y=d; }
                   };
12.
     Consider the following code:
     #include<iostream.h>
     class A { public:
                    A() { cout<<"A";}
                    ~A() { cout<<"~A"; }
              };
     class B { public:
```

```
B() { cout<<"B";}
                       ~B() { cout<<"~B"; }
                  };
      class C { public:
                       C() { cout<<"C";}
                       ~C() { cout<<"~C"; }
                    private:
                       B c1;
                       A c2;
                  };
      class D { public:
                       D() { cout<<"D";}</pre>
                       ~D() { cout<<"~D"; }
                  };
      class E:public C
      { public:
             E() { cout<<"E";}</pre>
             ~E() { cout<<"~E"; }
          private:
             D e1;
             C e2;
      };
      int main()
      {
             Ee;
             return 0;
      If the program compiles and runs correctly, what dos it prints out?
Ans.
      Output:
      BACDBACE~E~C~A~B~D~C~A~B
      How does the invocation of constructor differ in derivation of class and nesting of classes?
13.
      In derivation of class first the base class constructor is invoked, followed by the derived class constructor, whereas in
Ans.
      nested classes constructors of all the member objects are called before the constructors of the object enclosing
      other objects.
14.
      A class One with data members int a and char b inherits from another class Two with data members float f and int
      x. Write definitions for One and Two for the following situations:
      (i) Objects of both the classes are able to access all the data members of both the classes.
      (ii) Only the members of class One can access all the data members of both the classes.
      (i) class Two
Ans.
             {
                   protected:
                       float f;
                       int x;
             };
             class One:private Two
                           int a;
                           char b;
            };
      (ii) class Two
                   public:
                       float f;
                       int x;
```

```
};
           class One: public Two
            {
                 public:
                     int a;
                    char b;
            };
      Assume a class Derv derived from a base class Base. Both classes contain a member function func() that takes no
15.
      arguments. Write the definition for a member function of Derv that calls both the func()s.
      class Base
Ans.
      {
          public:
            void func()
            {
                  cout<<"base class";</pre>
            }
      };
      class Derv: public Base
      {
          public:
            void func()
            {
                  cout<<"derived class";</pre>
            ł
            void callAll()
            ł
                   Base::func();
                   func();
            }
      };
      What will be the output of the following program?
16.
      #include<iostream.h>
      class Student
      {
        public:
            Student (char pname[]=" ")
            {
                  strcpy(name,pname);
                  average=semesterHours=0;
            }
            void addCourse(int hours,float grade)
            {
                  average=(semesterHours*average+grade);
                  semesterHours+=hours;
                  average=semesterHours;
            ļ
            int hours()
                  { return semesterHours; }
            float gpa()
                  { return average; }
        protected:
            char name[40];
            int semesterHours;
```

```
float average;
      };
      class GradStudent: public Student
      {
            public:
                   GradStudent(char pname[]=" "):Student(pname)
                    {
                          qual_grade=0;
                   int qualifier()
                             return qual_grade; }
            protected:
                   int qual_grade;
      };
      int main()
      {
            Student commerce("Saurabh 7/.");
            GradStudent qs;
            commerce.addCourse(4,2.5);
            gs.addCourse(4,3.0);
            return 0;
Ans.
      Above code will generate various compilation errors few of them are listed below-
      i. strcpy(name, pname); gives error due to missing string.h file
      ii. After adding the required header file code will execute but screen will appear blank due to missing output
         statements.
      #include<iostream.h>
17.
      class a
      {
        public:
            void something()
                 cout<<"a"; }
            {
      };
      class b
      {
        public;
            void something()
            { cout<<"b"; }</pre>
      };
      class c:public a,public b {};
      int main()
      {
            c x;
            x.something();
            return 0;
      }
      (a) a::something() is called
      (b) b:: something() is called
      (c) Runtime Error
      (d) Syntax Error
Ans.
      (d) Syntax Error
      #include<iostream.h>
18.
      class basex
      {
              int x;
       public:
              void setx(int y) { x=y; }
```

	};		
	<pre>class derived:basex { };</pre>		
	What is the access level for the member function "setx" in the class "derived" above?		
	(a) protected (b) private (c) local (d) public		
Ans.	(b) private		
19.	<pre>class professor {};</pre>		
	<pre>class teacher:public virtual professor {};</pre>		
	class reasearcher:public virtual professor {};		
	<pre>class myprofessor:public teacher,public reasearcher {};</pre>		
	Referring to the same code above, if a object of class "myprofrssor" were created, how many instances of		
	professor will it contain?		
	(a) 4 (b) 1 (c) 2 (d) 3		
Ans.	(b) 1		
20.	When does ambiguity arise in multiple inheritance? How can one resolve it? What are virtual base classes? What		
-	is their significance?		
Δns.	An ambiguity can arise when several naths exist to a class from the same base class. This means that a child class		
/ 11.51	could have duplicate sets of members inherited from a single hase class. This can be solved by using a virtual hase		
	class		
	When two or more objects are derived from a common base class, we can provent multiple conject of the base class		
	when two of more objects are derived from a common base class, we can prevent multiple copies of the base class		
	being present in an object derived from those objects by declaring the base class as virtual when it is being inherited.		
	Such a base class is known as virtual base class.		
	When a class is made virtual, necessary care is taken so that the duplication is avoided regardless of the number of		
	paths that exist to the child class.		
21.	Answer the questions (i) and (iv) based on the following:		
	class Student		
	int Rollno;		
	char SName[20];		
	float Marks1;		
	protected:		
	void Result();		
	public:		
	Scudenc();		
	void Digplay().		
	\.		
	// class Teacher		
	long TCode:		
	char TName[20]:		
	protected:		
	float Salary:		
	public:		
	Teacher ();		
	void Enter();		
	<pre>void Show();</pre>		
	};		
	class Course:public Student,private Teacher		
	{		
	long CCode[10]		
	<pre>char CourseName[50];</pre>		
	<pre>char StartDate[8],EndDate[8];</pre>		
	public:		
	Course();		

	void Co	mmence();
	void CD	<pre>etail();</pre>
	};	
	(i)	Write the names of member functions, which are accessible from objects of class Course.
	(ii)	Write the names of all data members, which is/are accessible from member function Commence
	( )	of class Course.
	(iii)	Write the names of all the members, which are accessible from objects of class Teacher
	(iv)	Which type of inheritance is illustrated in the above $C_{++}$ code?
Anc	(i)	which type of inferitance is indistrated in the above C++ code:
Ans.	(1)	Volu Commence(), volu Cbetall(), volu Enroll (), volu Display (),
	(11)	CCode, CourseName, StartDate, EndDate, Salary
	(111)	void Enter ( ), void Show ( );
	(iv)	Multiple inheritance
22.	Answer the qu	estions (i) to (iv) based on the following:
	class Ball	
	{ char	Btype[10];
	protect	ed:
	float	t Rate;
	void	CalcRate(float);
	public:	
	Ball	();
	void	BInput();
	void	BShow();
	void	TEntry();
	void	TDisplay();
	};	
	class Soft	Toys:public Toys
	{ char	STName[20];
	float	t Weight;
	public:	
	SofTo	oys();
	void	STEntry();
	void	STDisplay();
	};	
	class Elec	tronicToys:public Toys
	{ char	ETName[20];
	char	No_of_Batteries;
	public:	
	Elect	<pre>tronicToys();</pre>
	void	ETEntry();
	void	<pre>ETDisplay();</pre>
	};	
	(i) Which type	e of Inheritance is shown in the above example?
	(ii) How many	bytes will be required by an object of the class SoftToys?
	, (iii) Write nam	e of all the data members accessible from member functions of the class SoftTovs.
	(iv) Write nam	e of all the member functions accessible from an object of the class ElectronicToys.
Ans	In above code	Ball class is not mentioned in inheritance process, it should be Toys class
A1151	(i) Hierarchical	Inheritance
	(II) So Byles	
	(III) Kate, STNa	me, weight
	(IV) ETEntery, E	Li Display, Binput, BShow, TEntery, TDisplay
23.	Answer the qu	estion (i) to (iv) based on the following code:
	class Trai	ner
	{	
	char	<pre>TNo[5], TName[20], Specialisation[10];</pre>

```
int Days;
        protected:
             float Remuneration;
             void AssignRem(float);
        public:
             Trainer();
             void TEntery();
             void TDisplay();
      };
      class Learner
      {
             char Regno[10], LName[20], Prpgram[10];
        protected:
             int Attendeance, Grade;
        public:
             Learner();
             void LEntery();
             void LDisplay();
      };
      class Institute: public Learner, public Trainer
      {
             char ICode[10],IName[20];
        public:
             Institute();
             vod IEntry();
             void IDisplay();
      };
      (i) Which type of Inheritance is depicted by the above example?
      (ii) Identify the member function(s) that cannot be called directly from the objects of class Institute from the
      following:
         TEntry()
          LDisplay()
          IEntry()
      (iii) Write name of all the member(s) accessible from member functions of class Institute.
      (iv) If class Institute was derived privately from class Learner and privately from class Trainer, then, name the
      member function(s) that could be accessed through Objects of class Institute.
Ans.
      (i) Multiple Inheritance
      (ii) None (Since all of these functions can be called from object of class Institute).
      (iii) Data Members: Remuneration, Attendance, Grade, ICode, IName
         Member Functions: AssignRem(), TEntry(), TDisplay(), LEntry(), LDisplay(), IEntry(), IDisplay()
      (iv) IEntry(), IDisplay
      Consider the following and answer the questions give below:
24.
      class MNC
      {
             char Cname[25]; //Compay name
           protected:
             char Hoffice[25]; //Head office
           public:
            MNC();
             char Country[25];
             void EnterData();
             void DisplayData();
      };
      class Branch: public MNC
      {
             long NOE
                         //Number of employees
             char Ctry[25]; //Country
```

```
protected:
            void Association();
           public:
            Branch();
            void Add();
            void Show();
      };
      class Outlet: public Branch
      {
            char State[25];
          public:
            Outlet();
            void Enter();
            void Output();
      };
         (i) Which class' constructor will be called first at the time of declaration of an object of class Outlet?
         (ii) How many bytes does a object belonging to class Outlet require?
         (iii) Name the member function(s), which are accessed from the object(s) of class Outlet.
         (iv) Name the data member(s), which are accessible from the object(s) of class Branch.
Ans.
      (i) class MNC
      (ii) 129 Bytes
      (iii) Enter(), Output(), Add(), Show(), EnterData(), DisplayData()
      (iv) Country [25]
25.
      Answer the questions (i) and (iv) based on the following:
      class Director
      {
           long DID;
                         //Director identification number
           char Name[20];
        protected:
            char Description[40];
            void Allocate();
        public:
            Director();
            void Assign();
            void Show();
      };
      class Factory: public Director
      {
            int FID;
                                    //Factory ID
            char Address[20];
        protected:
            int NOE
                                    // No Of Employees
        public:
            Factory();
            void Input();
            void Output();
      };
      class ShowRoom: private Factory
      ł
         int SID;
                                     //ShowRoom ID
         char City[20];
       public:
         ShowRoom();
         void Enter();
         void Display();
      };
```

	(i) Which type of inheritance out of the following is illustrated in the above C++ code?
	a) Single level inheritance
	b) Multi level inheritance
	c) Multiple inheritance
	(ii) Write the names of data members, which are accessible by objects of class type ShowRoom.
	(iii) Write the names of all member functions which are accessible by objects of class type ShowRoom.
_	(iv) Write the names of all members, which are accessible from member functions of class Factory.
Ans.	(I)Multi level inheritance
	(II) NONE (iii) Entar(), Display(), Entar(), Display()
	(iii) Enter(), Display(), Enter(), Display() (iv) Data Mambars: EID. Addross, NOE
	(iv) Data Members: FID, Address, NOE Member Functions: Input(). Output()
26.	Answer the substitute (i) to (iv) based on the following:
20.	Answer the questions (i) to (iv) based on the following:
	char CenterCode[10];
	public:
	<pre>void Input( );void Output( );</pre>
	}; 
	Class Online
	t char website[50]:
	public:
	void SiteIn( );
	<pre>void SiteOut( );</pre>
	<pre>};</pre>
	<pre>class Training: public FaceToFace, private online {</pre>
	long Tcode;
	float charge;
	int period;
	public:
	vold Register();
	(i) Which type of inheritance is shown in the above example?
	(ii) Write names of all the member functions accessible from Show() function of class Training.
	(iii) Write name of all the member accessible through an object of class Training.
	(iv) Is the function Output( ) accessible inside the function SiteOut( )? Justify your answer?
Ans.	(i) Multiple Inheritance
	(ii) Register( ) SiteIn( ), SiteOut( ), Input( ), Output( )
	(iii) Register( ), Show( ), Input( ), Output( ).
	(iv) No, function Output() is not directly accessible inside the function SiteOut(), because Output() is a
	member function of class FaceToFace and SiteOut() is a member function of class Online, and the classes
	FaceToFace and Online are two independent classes.

## LONG ANSWER QUESTIONS

Imagine a publishing company that markets both books and audio-cassette versions of its works. Create a class publication that stores the title (a string) ad price (type float) of a publication. From this class derive two classes: book, which adds a page count (type int); and tape, which adds a playing time in minutes (type float). Each of these three classes should have a getdata() function to get its data from the user at the keyboard, and a putdata()

```
function to display its data.
      Write a main() program to test the book and tape classes by creating instances of them, asking the user to fill in
      their data with getdata(), and then displaying the data with putdata().
Ans.
      #include<iostream.h>
      #include<conio.h>
      #include<stdio.h>
      class publication
      {
            char title[20];
            float price;
         public:
            void getdata()
                  cout<<"Enter title: ";</pre>
                  gets(title);
                  cout<<"Enter price: ";</pre>
                  cin>>price;
            }
            void putdata()
                   cout<<"Title: "<<title<<endl;</pre>
            {
                  cout<<"Price: "<<price<<endl;</pre>
            }
      };
      class book: public publication
      {
            int page_count;
           public:
            void getdata()
                  publication::getdata();
            {
                  cout<<"Enter page count: ";</pre>
                  cin>>page_count;
            }
            void putdata()
                  publication::putdata();
            {
                  cout<<"Page count: "<<page_count<<endl;</pre>
      };
      class tape: public publication
      {
            float play_time;
           public:
            void getdata()
                   publication::getdata();
            ł
                  cout<<"Enter Play time: ";</pre>
                  cin>>play_time;
            }
            void putdata()
                   publication::putdata();
            ł
                  cout<<"Play time: "<<play_time<<endl;</pre>
            }
      };
      void main()
      {
           clrscr();
            book b;
            tape t;
            b.getdata();
```

```
b.putdata();
             t.getdata();
             t.putdata();
             qetch();
 2.
      Assume that a bank maintains two kinds of accounts for customers, one called as savings account and the other as
      current account. The saving account provides compound interest ad withdrawal facilities but not cheque book
      facility. The current account provides cheque book facility but no interest. Current account holders should also
      maintains a minimum balance and if the balance falls below this level, a service charge is imposed.
      Create a class Account that stores customer name, account number and opening balance.
      From this derive the classes Current and Saving to make them more specific to their requirements. Include
      necessary member functions in order to achieve the following tasks:
      (i) deposit an amount for a customer and update the balance
      (ii) display the account details
      (iii) compute and deposit interest
      (iv) withdraw amount for a customer after checking the balance and update the balance.
      (v) check for the minimum balance (for current account holders), impose penalty, if necessary, and update the
      balance.
      Implement these without using any constructor.
Ans.
      #include<iostream.h>
      #include<conio.h>
      #include<stdio.h>
      #include<process.h>
      int const min=500;
      class Account
      {
             char name[20];
             long ano;
            public:
             void getdata()
                    cout<<"Enter customer name: ";</pre>
                    gets(name);
                    cout<<"Enter account no.: ";</pre>
                    cin>>ano;
                    cout<<"Enter opening balace: ";</pre>
                    cin>>balance;
             }
             void display()
                    cout<<"Customer name: "<<name<<endl;</pre>
                    cout<<"Account no: "<<ano<<endl;</pre>
                    cout<<"Balance :"<<balance;</pre>
             }
      };
      class Current: public Account

            public:
            void getName()
            ł
                   cout<<"Enter name:";</pre>
                   gets(spousename);
            void display()
              cout<<"Name: "<<name<<endl;</pre>
                cout<<"Phone: "<<phone<<endl;</pre>
                cout<<"spouse name: "<<spousename<<endl;</pre>
            Spouse()
                 strcpy(spouseName,"NULL");
            Spouse(char sn[20])
                  spouseName=sn;
      };
 5.
      Modify the above program so that Clerk and Officer classes contain object of another class called Education that
      holds two pieces of educational information, namely qualification and experience. Incorporate the functions for
      handling this additional information.
Ans.
      Question referring the class are not mentioned in any of the above question.
 6.
      Write a C++ to read and display information about employees and managers. Employee is a class that contains
      employee number, name, address ad department. Manager class contains all information of the employee class
      and a list of employees working under a manager.
      #include<iostream.h>
Ans.
      #include<conio.h>
      class employee
      ł
        public:
          int num,house ;
          char city[20], state[20], name[20], depart[20];
        public:
          void input()
          {
             cout << "Enter the employe's name";
             cin>>name;
             cout << "Enter the employe number";
             cin>>num;
             cout<<"Enter the address including house number ,city ,state";
             cin>>house>>city>>state;
             cout<<"enter the department";</pre>
             cin>>depart;
          }
          void output()
           ł
             cout<<"\nemploye's infomation:";</pre>
             cout<<"\n"<<name<<"\n"<<"address -:" <<"\n"<<house<<"</pre>
      "<<city<<"\n"<<state;</pre>
             cout<<"\n"<<depart;</pre>
```

```
};
       class manager: public employee
       {
            char name[20];
            int n ,i;
            public:
              void getdata()
              ł
                  cout << "Enter the manager's name";
                  cin>>name;
                  cout << "enter the total number of employe's working under him";
                  cin>>n;
              }
              void info();
       };
       void manager::info()
       {
           getdata();
           for(i=1;i<=n;i++)</pre>
               input();
           }
           cout<<name;</pre>
           cout<<"\nemploye's are-:n" ;</pre>
           for(i=1;i<=n;i++)</pre>
           ł
               cout<<i<< employe-:" ;</pre>
               output();
           }
       }
       void main()
       {
           class manager M;
           clrscr();
           M.info();
           getch();
       Create the following class hierarchy in C++.
 7.
                 class student
               data
                     :name
